Gaussian near $T = 0$ · small differences require a controlled initial spectrum
Whole envelope: almost unchanged near zero
T=0
T=0.025
T=0.1
$|u|$
s
Magnified tails on a logarithmic scale
$|u|$
s
Initial projection already produces tiny ripples
Initial cutoff 12
Initial cutoff 24
Absolute initial discrepancy
s
A fixed tail region: $|u(s, 0)| < 0.01\,P(0)$
Effect of initial cutoff
Dysthe minus linear (cutoff 24)
Maximum absolute complex difference
T
