First batch: all families, with two curves per panel
alpha = 1/2; short-time, finite-box screening
Gaussian
Elongated Gaussian
Smooth compact bump
Two packets
Chirped Gaussian
Tapered algebraic profile
Spectrum near degeneracy
Spectrum away from degeneracy
Random packet: seed 11
Random packet: seed 22
Random packet: seed 33
Homogeneous (minus, beta=0)
Inhomogeneous (plus, beta=1)
Decay-test ratio R(t), displayed in units of 0.001
Evolution time t
How to read these panels
One input family per panel.
Blue and orange = two equations.
Vertical axis: decay-test ratio.
Flat: matches the candidate power.
Falling: faster over that interval.
Rising: slower over that interval.
Short-time growth does not
disprove a uniform bound.
